interest in the study of geometry is currently enjoying a resurgence understandably so as the study of curves was once the playground of some very great mathematicians however many of the subject s more exciting aspects require a somewhat advanced mathematics background for the fun stuff to be accessible we need to offer students an introduction with modest prerequisites one that stimulates their interest and focuses on problem solving integrating parametric algebraic and projective curves into a single text geometry of curves offers students a unique approach that provides a mathematical structure for solving problems not just a catalog of theorems the author begins with the basics then takes students on a fascinating journey from conics higher algebraic and transcendental curves through the properties of parametric curves the classification of limaçons envelopes and finally to

projective curves their relationship to algebraic curves and their application to asymptotes and boundedness the uniqueness of this treatment lies in its integration of the different types of curves its use of analytic methods and its generous number of examples exercises and illustrations the result is a practical text almost entirely self contained that not only imparts a deeper understanding of the theory but inspires a heightened appreciation of geometry and interest in more advanced studies
